

SPECIFICATION OF TERMITE TREATMENT METHODS

For the home at 817 Brett Drive Allen, Tx 75013, Terminator Pest Solutions will perform 2 types of termite treatments. The first will be a liquid treatment for the soil and under the slab and the second will be a bora care treatment for the wood frame.

Liquid Termite Treatment: A liquid barrier **places termiticide in the soil around your home.** This liquid material will kill termites that try to pass through the soil to get to your home, and it can last for many years. We will trench 6inch by 6inch around the perimeter of the home and inject a rod into the soil to treat under the slab

Bora-Care Treatment: Bora-Care Termiticide is a **plant-based termite treatment for wood that is injected directly into the infested areas.** The active ingredient in Bora-Care is borate salt, which safely and effectively controls termites, ants, and other pests by interrupting their ability to process the food they eat. We will treat the wood framing with Bora-Care with a blue die added to show where the frame has been treated
